

# Project controls management

EPC Power Management is a unique company that combines high level knowledge with stable manpower. We have been providing structured and stable results in technical complex environments. We do not just provide people: we provide solutions

## Controlling your project

The main questions in every complex industrial project are:

- Do we work according to the original objectives and qualifications?
- Will this project be delivered on time?
- Will the project be completed within the originally defined budget?

Executing projects within above given parameters tend to be more and more complicated. Contractors will try to reach to the limits of what is profitable for them whilst you as an owner are mainly interested in budget conformity, quality and compliance to laws and regulations and delivery on time.

This complicated process can be very well accommodated by the project controls consultants and managers of EPC Power Management.

We have an extensive working experience in controlling complex projects in a range of between € 5 million up to € 1.7 billion.

A project controls system should be established for each capital project. The scope and detail of the controls system should be based on the size, complexity, sensitivity and execution strategy of a specific project.

### Each project controls system should include:

**A Cost Management Process**, that estimates, monitors, predicts and reports project cost.

**A planning and Scheduling Management Process**, that plans project activities, monitors completion of those activities, predicts timing of future activities and reports schedule status.

**A Change Management Process**, that estimates the impact of change, enables and documents the change decision, and integrates the change in the project scope of work.

**A Compliance Risk Management Process**, that monitors the risks involved looking at the constant changes concerning rules and regulations of government and notifying bodies.
